The runbook

Wispr Flow India hiring challenge · Nikhil Balamurugan · submit by **Tue 3 Nov, 21:00 IST** · the form closes Wed 4 Nov.

Everything you need to do, in order, with the exact words to say. I generate it from the files in `~/Documents/wispr-challenge`, so it always matches them.

Contents

Part 1 · The truth check (answered 30 Oct)
Part 2 · Day by day
Part 3 · Emergent prompts, ready to speak
Part 4 · The four small tests
Part 5 · The video
Part 6 · The form
Part 7 · The $3,000 answer
Part 8 · The posts
Part 9 · If something goes wrong
Appendix · Every word on the site

How to read this

- **Blue boxes** are lines to say. Hold your Flow key and speak them, into Emergent, a note or the camera, whichever the step says.
- **Yellow boxes** are exact text to paste or to save as a Flow snippet.
- **[Square brackets]** are the only gaps. Each one is a real result that doesn't exist yet (a number from your own test). I fill them in on Monday. Where a result could go either way, every version of the line is already written; you read the one that happened.
- **"Send me"** means: message me in this chat, by voice.

What's yours, and what's mine

You	Me (Claude)
Speak every Emergent prompt (Part 3)	Wrote every prompt, the site copy and the script
Run the four small tests (Part 4)	Score the tests, write the results, check every number
Record and upload the video (Part 5)	Fill the script with your real numbers on Monday
Fill and submit the form (Part 6)	Count the $3,000 answer, check the form against the site
Answer the truth check (Part 1)	Run the automated site check after each publish

Five rules

1. **One email everywhere:** Wispr Flow, the Toolkit form, Emergent and the application form.
2. **Flow on for everything this week.** Messages, notes, prompts. That activity is how they verify you used voice.
3. **Screen-record every Emergent session.** That's your video footage.

4. **Never put a number on the site that isn't in `CLAIMS.md` or `evidence/results.md`.** If a test didn't happen, the site says "not run".
5. **The site says honestly who did what.** You spoke every instruction. I planned it and drafted the copy from your projects. Emergent wrote the code.

Part 1 · The truth check (answered 30 Oct)

I wrote the site copy from your repos and resume, and you confirmed or corrected the seven lines only you could know. Here's what is now on the site.

#	Where on the site	Your answer	What the site now says
T1	Skipp · why I chose it	Your own reason	"On the Student Portal, none of this is easy to see. So I built an easier way."
T2	Drishti · why I chose it	Yes	"For most people, voice is a convenience. For a blind user on an Indian website, it's the whole interface. I wanted to build for that case."
T3	Recoup · why I chose it	Yes	"Razorpay publishes what every error means. I wanted to see what happens when a system actually listens to it."
T4	Setbacks · Skipp got shut out	It broke for students; the Oracle server fixed it	Attendance stopped loading for Student Portal users until a small Hyderabad server on Oracle's free tier carried those requests. It works now.
T5	Top bar, logistics, video, form	Exams 25 Nov–7 Dec; next semester from early January, and you can intern through it	**Start: 9 December 2026** (your last exam is 7 Dec, plus a day to travel to Bangalore), full time from then, including through next semester.
T6	Resume line and More work · Allotiq	Echo qualified in round one; Allotiq was the finals project	"Vision2Web 2026, 2nd place (Allotiq)". Echo is named as the first-round project. 2nd place, confirmed. The README's "Winner" gets changed after you submit.
T7	Setbacks	No	The three documented setbacks stay as they are.

One thing for later (not needed to submit)

The department's OD or NOC for the January semester. You confirm it with your HOD once you have the internship offer (the hire is announced 20 Nov). Until then the site and video say what's true today: you can intern full time from 9 Dec, through next semester. If a shortlist call asks, say you'll confirm with your HOD as soon as there's an offer.

Part 2 · Day by day

About 1.5 hours a day, around your exams. Do the items in order. Skip the ones marked *optional* if you're short on time.

Friday 30 October (today)

#	Do	Time	Lines are in
1	**If you haven't yet: the Toolkit form.** Challenge page → "Get your Toolkit" → Name: Nikhil Balamurugan · Email: **your Wispr Flow email** · Phone: +91 and your number → "Get my credits". Screenshot it as `application/toolkit.png`. Credits arrive within about 10 hours.	5 min	none
2	**Flow plan.** Open the Flow Hub and check how many words you have left this week. Turn on the student offer or the Pro trial if it's offered. Screenshot the Hub as `assets/flow-hub/2026-10-30.png`.	5 min	none
3	**Voice baseline.** Screen recording on; type the paragraph, then say it; then say the 7 name sentences. Send me the times and what Flow got wrong.	10 min	Part 4 · E-0
4	**The four Flow snippets.** Flow → Snippets → add each one.	5 min	Part 3, last section
5	**Truth check.** Send me your answers.	5 min	Part 1
6	**Save the work to GitHub.** Run the two commands below in Terminal.	2 min	below
7	**When the credits arrive: Emergent, steps 0, 1 and 2.** Publish v0. Send me the URL.	45 min	Part 3
8	**Skipp screenshots.** Save the Vercel Analytics views (overview, devices, referrers, pages) to `assets/skipp/`.	2 min	none
9	**Diary line** (say it into a note), plus a Flow Hub screenshot.	1 min	Part 4 · E-1

```
cd ~/Documents/wispr-challenge && git add -A && git commit -m "Set up challenge workspace and pre-register exam-week evidence"
```

```
git push -u origin setup/workspace
```

Saturday 31 October

#	Do	Time	Lines are in
1	Emergent step 3: put in the real words	15 min	Part 3
2	Emergent step 4: the squeeze and unsqueeze	30 min	Part 3

#	Do	Time	Lines are in
3	Emergent step 5: the long versions	20 min	Part 3
4	Emergent step 6: the other sections, then **re-publish**. Send me "republished".	20 min	Part 3
5	**Tanglish test (E-2).** Paste the 24 outputs into `evidence/e2-tanglish/scoring.csv`, or send them to me.	15 min	Part 4 · E-2
6	Diary line plus Flow Hub screenshot	1 min	Part 4 · E-1

Sunday 1 November

#	Do	Time	Lines are in
1	Emergent step 7: the ask box. Send me "ask box done".	30 min	Part 3
2	*Optional:* Emergent step 8, the microphone, only if step 7 took under 45 minutes	30 min	Part 3
3	**Android setup audit (E-3).** Send me the recording's file name.	15 min	Part 4 · E-3
4	**Fix pass.** I send you a short list of lines to say, from my automated check of your site.	20 min	my message
5	Diary line plus Flow Hub screenshot	1 min	Part 4 · E-1

Monday 2 November

#	Do	Time	Lines are in
1	**Review check (E-4).** I send you 20 reviews; you pick the main theme of each.	15 min	Part 4 · E-4
2	Emergent step 9: the exam-week results (I prepare the text)	20 min	Part 3
3	Emergent step 10: polish, then **re-publish and freeze**	20 min	Part 3
4	**Read the video script aloud once, with a stopwatch.** I fill in your numbers first. It must come in under 2:50.	15 min	Part 5
5	Diary line plus Flow Hub screenshot	1 min	Part 4 · E-1

Tuesday 3 November: submit

#	Do	Time	Lines are in
1	Record the video	60 min	Part 5
2	Upload it unlisted to YouTube and test it logged out	15 min	Part 5

#	Do	Time	Lines are in
3	**Submit the form by 21:00.** Screenshot the confirmation.	15 min	Part 6
4	Post on LinkedIn and X	15 min	Part 8
5	Send me the confirmation screenshot	1 min	none

Wednesday 4 November

Exam. Nothing new. Only fix something if it's broken.

After submitting: change the Allotiq README on GitHub from "Vision2Web Winner 2026" to "Vision2Web 2026, 2nd place".

Part 3 · Emergent prompts, ready to speak

Each step has the same parts:

- **Do:** what to set up first.
- **Say:** the lines in the blue box. Hold your Flow key and speak them into Emergent's chat. You can read them out as they are; adding your own words is fine.
- **Paste:** exact text from a file, in Emergent's chat box after you've spoken.
- **Check:** how to know it worked.
- **If it goes wrong:** a line to say back to Emergent.

When a line contains a snippet name (*exam hall tokens*, *section contract*, *matcher rules*, *debug contract*), just say the name and Flow types the full text for you. Create the snippets first (the last section of this file). If snippets don't work for you, paste the snippet text at that point instead.

After every step:

1. Copy what Flow actually typed into `build-log/prompts/NN-step.md`.
2. Note the credits before and after.
3. Add one line to `voice-log.md` if voice got something wrong or made something easier.

Keep the screen recording running the whole time. These clips go in the video.

Step 0: before you start (5 minutes, no speaking)

Do:

1. Sign in to Emergent with the **same email as your Wispr Flow account**.
2. Check the credits arrived, and that a **Publish** option exists for your account. Emergent's Free plan can't publish. If you can't find Publish, stop and tell me.
3. Start a new job in the **Fullstack Builder** window.
4. When it asks for an app or project name, use **nikhil-long-version**. The address becomes `nikhil-long-version.emergent.host` and can never be renamed.
5. Start the Mac screen recording: Cmd + Shift + 5 → Options → Microphone: MacBook microphone → Record Entire Screen.

Step 1: talk the idea through first (Friday, 5 minutes)

Use the **Brainstorm** window if it's offered and cheap; otherwise say this as your first message in the Fullstack Builder.

Say:

> Hi. Before we build anything, I want to plan a one-page portfolio site for the Wispr Flow India hiring challenge. The idea is called "the long version". The first thing a visitor sees is my real resume, squeezed sideways so it's almost too dense to read, under a headline that says: 2,000 people sent you this, ask for the long version. Three lines of the resume can be tapped. When you tap one, it un-squeezes back to normal width and opens the full story behind it. Below that are sections for my setbacks, how I make decisions, my exam-week evidence, three growth experiments for Wispr Flow India, how I built this site by voice, and logistics. Visitors can type a question or tap a suggestion, and the page opens the right section. Later they can say it out loud. There is no AI behind that, just a list of phrases I'll give you. It must be frontend only: no backend, no database, no login, no analytics, and no AI calls. Mobile first, accessible, and fully usable with a keyboard. Don't build anything yet. Ask me your questions first.

If it asks these, say:

It asks	You say
Universal LLM key or your own key?	"Neither. There's no AI in this site at all."
Should I add a backend or database?	"No. Frontend only. Everything is static."
Do you want login or authentication?	"No login of any kind."
Any design preferences?	"Yes: *exam hall tokens*."
Which framework?	"Your default for frontend is fine. React with Tailwind is fine."
Anything else	Answer in one or two sentences. If you don't know, say "keep it simple, you choose."

Check: it plays back a plan with the eight sections, frontend only, no AI.

Step 2: the skeleton, then publish v0 (Friday, 30–45 minutes)

Say:

> Build the skeleton of the site now. It's a single page, frontend only: no backend calls, no database, no authentication, no AI, and no analytics. *section contract*. Each section gets a heading and one line of placeholder text for now. The page has exactly one h1, which is my name, Nikhil Balamurugan, in a slim top bar. The top bar also says: starts 9 December 2026, dot, relocating to Bangalore. It has an Ask button that jumps to the ask box in the first section. Use these design tokens: *exam hall tokens*. Make it mobile first. At 375 pixels wide, nothing should scroll sideways. Add a skip-to-content link for keyboard users. Don't add anything I haven't asked for.

Do: when it says it's done, click **Publish**. It takes 10–15 minutes.

Check:

- Open the published URL in an incognito window, and on your phone.
- All eight sections are there, and the top bar shows your name, the date and Bangalore.
- Nothing scrolls sideways on the phone.
- **Send me the URL.**

If it goes wrong, say:

> Remove the backend and the database. This site is static: frontend only, no API calls.
>
> Remove the [thing it added]. Only build what I asked for.
>
> Load Roboto Flex from Google Fonts with the width axis from 25 to 151 and the weight axis from 100 to 1000, plus Instrument Serif italic and Geist Mono, and use them the way the design tokens say.

Step 3: put in the real words (Saturday, 15 minutes)

Do: finish the truth check first (runbook, Part 1). I update `content/site-copy.md` with your answers.

Say:

> Now replace all the placeholder text with my real content. I'm pasting it below. Put every piece of text into one content data file, and have the page read from it, so I can change the words later in one place. Use my words exactly. Don't rewrite, shorten, or add anything. Where it says MONDAY or TUESDAY in square brackets, show a small grey "coming soon" label instead.

Paste: everything in `content/site-copy.md` from the line "## Top bar" to the end.

Check: open the site.

- All ten resume lines are there.
- Skipp's "what didn't work" reads exactly as in the file.
- Nothing sounds rewritten.

If it goes wrong, say:

> You changed my wording in the [section name] section. Put back the exact text from the content I pasted, and don't edit my words again.

Step 4: the squeezed resume and the unsqueeze (Saturday, 30 minutes)

Say:

> Now the main interaction, in the first section. Show the resume lines squeezed horizontally, so they look compressed and almost too dense to read. Use Roboto Flex with the width axis set to 30. The three lines for Skipp, Drishti and Recoup are buttons. Each one has aria-expanded, and aria-controls pointing at its long version: lv-skipp, lv-drishti and lv-recoup. When someone clicks, taps or presses Enter on one, three things happen. First, that line animates from squeezed to normal width over about 700 milliseconds, with the easing cubic-bezier 0.16, 1, 0.3, 1. Second, the highlighter colour sweeps in behind it. Third, its long version opens, and keyboard focus moves to that long version's heading. The headline above the resume has two lines: "2,000 people sent you this." in heavy lowercase, then "ask for the long version." in Instrument Serif italic, in ballpoint blue. If the visitor prefers reduced motion, skip the animations, but everything should still open.

Check:

- Press Tab until the Skipp line is highlighted, then press Enter. It un-squeezes and Skipp's long version opens.
- Tap it on your phone; that works too.
- Turn on reduced motion (System Settings → Accessibility → Display → Reduce motion). Nothing animates, and lines still open.

If it goes wrong, say:

> The squeeze isn't showing. Instead of the font width axis, use transform scaleX 0.55 with transform-origin left on the squeezed lines, and animate back to scaleX 1.
>
> Focus doesn't move when a long version opens. After it opens, move keyboard focus to its heading.
>
> On my phone the squeezed lines run off the screen. Let them wrap instead of overflowing.

Step 5: the long versions (Saturday, 20 minutes)

Say:

> Now style the three long versions in the long-versions section. Each has the same seven labelled parts, in this order: the problem, why I chose it, what I owned, what I built, the evidence, what didn't work, and what I'd do differently. Put the part labels in Geist Mono, small and uppercase. Each evidence line keeps its small source and date note. The "what didn't work" label uses the red pen colour, and always keeps its words next to it. Behind the long versions only, add very faint ruled lines like an exam answer sheet, with a thin red margin line on the left. The text must stay easy to read.

Check: all three read comfortably on your phone, and the ruled lines are barely visible.

If it goes wrong, say:

> The ruled lines are too strong. Make them much fainter, so they're barely visible behind the text.

Step 6: the other sections, then re-publish v1 (Saturday, 20 minutes)

Say:

> Now style the remaining sections the same way: setbacks, principles, exam week, wispr ideas, how built and logistics. Each section starts with a small uppercase eyebrow in Geist Mono, then a two-line headline. The first line is heavy and lowercase; the second is in Instrument Serif italic, in ballpoint blue. In setbacks, each entry shows its three parts: what happened, what I decided, and what changed. In exam week, the "coming soon" results should look clearly unfinished, not hidden. The three Wispr ideas are cards, each with the same six labelled rows. In logistics, show the start date and the Bangalore line in large text. Then make sure nothing scrolls sideways at 375 pixels.

Do: Re-publish (it's free).

Check: incognito and phone. **Send me the URL** and I run the automated check.

Step 7: the ask box (Sunday, 30 minutes)

Say:

> Now the ask box in the first section. It has a text input, a submit button, a row of suggestion chips, and a status line, with the test ids from the section contract. The status line is an aria-live polite region. Use the intents data I'm pasting below. Each chip shows an intent's chip text, and tapping it opens that intent. When someone submits text, match it with these rules: *matcher rules*. On a match, scroll to the intent's target, open it if it's a long version, and set the status line to "opening" followed by the intent's label. Also: *debug contract*.

Paste: the whole of `content/intents.json`. To copy it: open it in TextEdit or VS Code, then Cmd + A, Cmd + C.

Check:

- Type "what failed" → the setbacks section opens.
- Tap "when can you start" → logistics opens.
- **Send me a message.** I run all 40 test questions against your site.

If it goes wrong, say:

> The matcher isn't following the rules exactly. Use the phrases, keywords, aliases, stopwords, threshold and noMatchBelow from the intents data, with the scoring I described, and nothing else.

Step 8 (only if Step 7 took under 45 minutes): the microphone (Sunday, 30 minutes)

Say:

> Now add a microphone button next to the ask box, as an extra, not a replacement. Use the browser's built-in speech recognition, SpeechRecognition or webkitSpeechRecognition, with the language set to English India, interim results on, and up to three alternatives. If the browser doesn't support it, the mic button says so, and the typed box stays. The visitor can hold the button to talk, or click once to start and again to stop. While listening, show the live words in ballpoint blue and the message "listening, let go to send". Send the final words through the same matcher as the typed box. The status line shows each state: listening, processing, matched, did you mean, didn't catch that, microphone blocked so type instead, not supported in this browser, and speech service unreachable. Under the button, show this line exactly: Your browser's speech service turns speech into text (Chrome uses Google). This site stores nothing.

Check: on the **published** URL, not the preview (previews can block the microphone):

- Chrome on your Mac;
- Chrome on your Android phone;
- Safari on an iPhone, if you can borrow one;
- Firefox shows the "not supported" message.

If it goes wrong, say:

> Remove the microphone feature completely and keep the typed ask box exactly as it was.

The mic is optional. Typed plus chips is enough.

Step 9: the exam-week results (Monday, 20 minutes)

Do: I prepare `content/monday-update.md` from your real results.

Say:

> I'm pasting the final text for the exam week section and the how-built section. Replace the "coming soon" labels with it, using my words exactly.

Paste: all of `content/monday-update.md`.

Check: every number on the page matches the file.

Step 10: final polish, then re-publish and freeze (Monday, 20 minutes)

Say:

> Final polish, without changing any text or adding features. Every button, link and input needs a visible focus ring: a 3-pixel outline in the highlighter colour. Check every text colour against its background for at least 4.5 to 1 contrast. Respect reduced motion everywhere. Every image needs alt text, and images below the first screen should lazy-load. Nothing should scroll sideways at 375 pixels. When you're done, tell me what you changed in three bullet points.

Do: Re-publish. After this, **no new features**. Only text and results changes.

Lines to say whenever something goes wrong

> Undo your last change. Keep everything else exactly as it was.
>
> Before you change anything, tell me in two sentences what you're going to do.
>
> Stop. Only fix the problem I described. Don't redesign anything.
>
> Something on the page is wider than a 375-pixel screen. Find it and fix only that.

Do: if a publish breaks the site, open **Manage Publishing** and roll back. Emergent keeps the last 3 versions.

The four Flow snippets (create these on Friday, before Step 1)

In Flow, open **Snippets** and add each one. The trigger is the short name; the text is what Flow types when you say it.

Trigger: exam hall tokens

```
Design tokens. Background paper #F4EFE4. Text ink #16140F. Accent highlighter #FFE14A, used only for the selected line, the focus ring and the main button. Ballpoint blue #2643C4, used for spoken text and the live transcript. Red pen #B82D22, used only on "what didn't work" labels and always next to a word. Fonts from Google Fonts: Roboto Flex (variable, width axis 25 to 151, weight 100 to 1000) for headings and body; Instrument Serif italic for accent lines; Geist Mono for small uppercase labels. Body text 18px, 17px on mobile, line height 1.55. No gradients, no drop shadows, no glassmorphism, no emoji.
```

Trigger: section contract

```
Use these exact section ids, in this order: squeezed, long-versions, setbacks, principles, exam-week, wispr-ideas, how-built, logistics. The three long versions use ids lv-skipp, lv-drishti and lv-recoup. The ask box: the input has data-testid ask-input, the submit button ask-submit, the chips container ask-chips, and the status line ask-status, which is an aria-live polite region.
```

Trigger: matcher rules

> Ask-box matching rules, with no AI and no network calls. Lowercase the text, remove punctuation, and replace any alias from the aliases list in the data. For each intent: the phrase score is 1 if any of its phrases appears inside the text; otherwise it is the best word overlap between the text and any phrase (shared words divided by all distinct words, ignoring the stopwords list). The keyword score is the number of the intent's keywords present, divided by 2, capped at 1. The final score is 0.6 times the phrase score plus 0.4 times the keyword score. Take the highest. Below the threshold in the data, show the top three intents as "did you mean" chips. If nothing scores at least noMatchBelow, say "didn't catch that: tap a chip or type".

Trigger: debug contract

> When the page address contains ?debug=intents, show a small panel with the top three intent scores for the last question, and expose window.__match(text), which returns an object with id, score, state and alternatives, using exactly the same matcher.

Part 4 · The four small tests

Each one takes 15 minutes or less. You do the speaking and recording; I do the scoring and the write-up. The predictions were written down before any test (`evidence/hypotheses.md`), so the results can't be bent to fit.

E-0 · Voice baseline (Friday, 10 minutes)

1. **Start the screen recording:** Cmd + Shift + 5 → Options → Microphone: MacBook microphone → Record Entire Screen.
2. **Typing.** Open Apple Notes. Start a stopwatch, type this paragraph exactly, then stop the stopwatch.
3. **Speaking.** New note. Start the stopwatch, hold your Flow key and say the same paragraph at a normal pace, then let go and stop the stopwatch.

> I built Skipp for SRM students because the portal never tells you how many classes you can still miss. Drishti is a voice agent for blind users in eleven Indian languages, built on Sarvam. Recoup recovers failed payments for Razorpay merchants. This week I have exams every day, so I am building my Wispr Flow portfolio entirely by voice, in Emergent.

That's 61 words. **Send me both times, and the words Flow got wrong.** I work out the speeds.

4. **Names.** Say each sentence on its own, **before** adding anything to Flow's dictionary:

> I built Skipp for SRM students.
>
> Drishti runs on Sarvam.
>
> Recoup works with Razorpay.
>
> I'm building it in Emergent with Wispr Flow.
>
> SRMIST is in Kattankulathur.
>
> Allotiq books rooms on campus.
>
> Tanglish is how I text my friends.

5. **Fix and retest.** For every name Flow got wrong, add it to Flow's dictionary, then say that sentence again. **Send me** which ones were wrong, and whether the dictionary fixed them. That's your "where voice broke, and the fix" story.

E-1 · Voice diary (every evening, 1 minute)

Say one line into a note, then screenshot the Flow Hub as `assets/flow-hub/DATE.png`:

> Today I used Flow for [what you used it for]. It [worked / failed] when [where, or why].

For example: "Today I used Flow for my WhatsApp messages and my Emergent prompts. It failed in the library, because I couldn't talk there." Only say what actually happened that day.

E-2 · Tanglish test (Saturday, 15 minutes)

First, fix the wording. If any sentence isn't how you'd really say it, change it in `evidence/e2-tanglish/phrases.md` before you test. Once you start testing, don't change them.

The run:

1. Quiet room, your phone.
2. Note Flow's language setting; don't change it.
3. Gboard voice typing set to English (India).
4. Open a WhatsApp chat with yourself.
5. Say each sentence **once in Flow** and **once in Gboard**. No retries: the first try is the result.
6. Copy all 24 outputs into `scoring.csv`, or send them to me.
7. For each output, add one word: **send** (you'd send it as it is), **edit** (a small fix needed) or **retype**.

The twelve sentences:

ID	Category	Phrase (say it naturally)	Key tokens
A1	English with Tamil words	Machan, I'll be late by ten minutes, wait pannu.	machan · late · ten minutes · wait pannu
A2	English with Tamil words	Da, did you finish the DBMS assignment or not? Sollu da.	da · DBMS · assignment · sollu
A3	English with Tamil words	Bro, canteen la idli is over, so I'm getting dosa.	canteen la · idli · dosa
B1	Tamil with English nouns	Naan library la irukken, assignment submit pannitu varen.	library la · irukken · assignment · submit pannitu · varen
B2	Tamil with English nouns	Indha semester attendance romba kammiya irukku, OD apply pannanum.	semester · attendance · romba kammiya · OD · apply pannanum
B3	Tamil with English nouns	Naalaikku exam irukku, naan seekiram thoonganum.	naalaikku · exam · seekiram · thoonganum
C1	Campus names	The bus from Potheri to Kattankulathur is late again.	Potheri · Kattankulathur · late
C2	Campus names	Meet me at Tech Park, fourth floor, after the lab.	Tech Park · fourth floor · lab
C3	Campus names	Tomorrow is day order four, so first hour is free.	day order four · first hour · free
D1	Numbers and times	Naalaikku 8 mani class cancel aayiduchu.	naalaikku · 8 mani · class · cancel · aayiduchu
D2	Numbers and times	Send me 250 rupees on GPay, naan apram tharen.	250 rupees · GPay · apram tharen
D3	Numbers and times	Hostel fees last date is November 15th, marakkaadha.	hostel fees · November 15th · marakkaadha

E-3 · Android setup audit (Sunday, 15 minutes)

1. **Phone ready:** Do Not Disturb on, so no notifications get recorded. Open a WhatsApp chat with yourself.
2. **Uninstall Flow.** Your account and dictionary come back when you sign in again.
3. **Start Android's screen recorder:** Quick Settings → Screen record.
4. **Play Store** → search "Wispr Flow" → install → open. Sign in with **your challenge email**, and allow and set up whatever it asks.
5. In the WhatsApp chat, dictate:

> This is my first message with Flow on this phone.

6. Stop recording as soon as that sentence appears correctly.
7. **Compare with Gboard.** Start a new recording. In the same chat, tap Gboard's mic and say the same sentence. Stop.
8. **Send me** both recordings' file names, your phone model and your Android version. I count the steps, the permission screens and the time.

Optional: the same on a family member's phone, with their OK. They tap, and you only answer their questions. In the repo they're "family member, about 50": no names.

E-4 · Review check (Monday, 15 minutes)

I read public reviews and posts about Wispr Flow from Indian users, and sort each one into a theme. On Monday I send you **20 of them, picked at random, without my themes**. For each, reply with its main theme:

Theme	It's mainly about
language	accent, Hindi, Hinglish, Tamil or other Indian languages, mixing languages
setup	installing, permissions, the keyboard, getting it to work in an app
accuracy	wrong words not caused by language (names, jargon, noise)
speed	slow, crashes, stops listening, needs internet
price	the price, free-plan limits, ₹ pricing, worth paying for
privacy	data, recordings, screen access, trust
praise	what it's good for (messages, email, notes, code)
other	anything else

I compare your themes with mine. If we agree on 14 or more of the 20, the counts go on the site. If not, they go on as "unchecked", or come off.

Part 5 · The video

The limit is 3:00. One path through this script is about 370 words, or roughly 2:40 at a normal pace with the demo pauses. Every line in a blue box is ready to say.

Square brackets are the only gaps. They are numbers or observations that don't exist yet, and I fill them in on Monday from `evidence/results.md` and `build-log/voice-log.md`. Where a result could go either way, there's a ready line for each outcome: read the one that matches.

0:00–0:12 · Hook · face to camera

> Over two thousand people sent Wispr Flow a resume last week. This is mine, squeezed onto one page. So I built the long version, entirely by talking, during exam week.

0:12–0:50 · What I built · screen recording of the site

> Every line on this resume opens into the story behind it. I'll just ask.

Type, or say into the mic: "what did you build that students actually use?"

> That's Skipp, an attendance app I built for SRM students. Every story has the same seven parts, including what didn't work. You can type, tap a suggestion, or speak. There's no AI behind this box, just phrases I wrote, because in Drishti, my voice agent, a simple keyword list beat an AI model at hearing a spoken yes or no.

0:50–1:35 · Why voice · your Emergent screen recording

> I spoke every instruction for this site into Emergent with Wispr Flow. I type at [TYPING] words a minute. I dictated at [DICTATION].

Then say two of these, only the ones that were actually true for you:

> Talking made me explain what I wanted properly. My spoken prompts were longer and clearer.
>
> I could think out loud and change my mind mid-sentence, and the prompt still came out clean.
>
> I said the failures out loud, so they sound like me, not like a resume.

Then the break. Use the true one, or tell me the real one:

> Where it broke: it wrote Skipp as "skip". I fixed that with Flow's dictionary, and used snippets for colour codes.
>
> Where it broke: colour codes and ids came out wrong, so I made Flow snippets for them.
>
> Where it broke: the Tamil words in the middle of my English sentences.

1:35–2:25 · Evidence · the site's evidence section

> Skipp: seven to fourteen students open it every day, and over ninety-two percent come straight from their home screen. I built a habit, not distribution, and that's the gap I want to work on. This week I measured what I could.

Tanglish (E-2). Read the line that matches Flow's send-as-is count [F], out of 12:

- **If F is 6 or more:**

  > I said twelve everyday Tanglish sentences into Flow and into Gboard. Flow got [F] ready to send as they were; Gboard got [G]. Tamil-English is closer than I expected.

- **If F is 3 to 5:**

  > I said twelve everyday Tanglish sentences into Flow and into Gboard. Flow got [F] ready to send, mostly the English-heavy ones; Gboard got [G]. So a Tamil campaign could start, but carefully.

- **If F is 0 to 2:**

  > I said twelve everyday Tanglish sentences into Flow and into Gboard. Flow got [F] ready to send; Gboard got [G]. Tanglish needs work before anyone markets it, and I'd hand over the sentences that broke.

Android setup (E-3). Skip this line if E-3 didn't happen:

> Setting Flow up on my Android phone took [STEPS] steps and [TIME]. The slowest part was [SLOWEST].

Public reviews (E-4). Skip this line if the hand-check didn't happen:

> Across [N] public reviews from Indian users, the most common complaint was [THEME].

Then:

> And I designed a seventy-two-hour campus trial, ready to run after exams.

The first experiment. Read the one the results point to (see `evidence/hypotheses.md`):

- **If Tanglish was 6 or more:**

  > If I joined, I'd first test Tamil creators racing a friend who's typing, because the language is ready.

- **If setup was the friction:**

  > If I joined, I'd first test a first task that gets new Android users to voice-type a message to their family.

- **Otherwise:**

  > If I joined, I'd first test a campus referral loop that counts friends who keep using it, not sign-ups.

2:25–2:50 · Why me · face to camera

> I'm a builder who runs growth experiments. I can ship the page, the tracker and the campaign myself, and then tell you honestly what worked, and what didn't. I can start on the ninth of December, right after my exams, and I'll relocate to Bangalore for the full internship.

2:50–3:00 · Close · URL on screen

> That was the long version. Thanks for listening.

How to record it (about 60 minutes)

1. **Room.** Quiet, fan off, window closed. Phone or laptop at eye level, light in front of you, not behind.
2. **Face parts** (hook, why me, close): QuickTime → File → New Movie Recording. At most three takes each; keep the best.
3. **Screen parts:** Cmd + Shift + 5 → Options → Microphone: MacBook microphone → Record Entire Screen. Do the site demo while saying the lines.
4. **The "why voice" part** reuses your Emergent screen recording from Friday or Saturday. Pick a 10–15 second clip of you speaking a prompt.
5. **Edit in iMovie:**
   - drag the clips in order: hook, demo, Emergent clip, evidence, why me, close;
   - trim the pauses;
   - **keep the total under 2:55**;
   - add a title with the URL at the end.
6. **Export:** File → Share → File → 1080p.

How to upload it (15 minutes)

1. Go to studio.youtube.com → Create → Upload videos, and pick the file.
2. **Title:** Nikhil Balamurugan · the long version (Wispr Flow India challenge).
3. **Audience:** "No, it's not made for kids".
4. **Visibility:** Unlisted. Save. Copy the link.

5. **Captions:** Subtitles → this video → the automatic English captions → Duplicate and edit. Fix Skipp, Drishti, Recoup, Wispr Flow and Emergent → Publish.
6. **Test:** open the link in an incognito window. It must play without signing in.

Part 6 · The form

1. Open the challenge page and click **Submit your build**.
2. Fill each field as below.
3. Dictate the text fields with Flow, but **paste the links**: voice is bad at URLs. That's one more true line for your voice log.

Field on the form	What to enter
Name	Nikhil Balamurugan
Wispr Flow account email	The email your Wispr Flow account signs in with. It must be the same one you used for the Toolkit form and Emergent.
What are you interested in?	**Internship**
When can you start?	**09/12/2026** in the date picker (your last exam is 7 Dec, plus a day to travel)
Portfolio URL	`https://nikhil-long-version.emergent.host`. Use the real address Emergent gave you. Paste it.
Recording URL	Your unlisted YouTube link. Paste it.
LinkedIn profile	`https://www.linkedin.com/in/nikhilb21/`
Your oddly specific setup requirement	The text in `application/setup-answer-final.txt` (500 characters at most)
Okay to feature your build and process publicly?	**Yes**

Before you press Submit:

- [ ] The portfolio link and the video link both open in an incognito window.
- [ ] The start date matches the site and the video.
- [ ] The email matches your Flow account.

After you press Submit:

- [ ] Take a screenshot of the confirmation. Save it as `application/submitted.png`.

If the department check changes the date

Change it in all three places on the same day:

- the site (logistics section and top bar);
- the video's "why me" line;
- this form.

If a semester needs to be mentioned, add this one line to the logistics section:

> I'll need [n] days for exams in [month]; everything else is full time.

Part 7 · The $3,000 answer

The form allows **500 characters**. Every count below is exact. Pick one version, replace the placeholder with your real result, then put just the final text into `application/setup-answer-final.txt` and count it again:

```
python3 -c "print(len(open('application/setup-answer-final.txt').read().strip()))"
```

Version 1, the default: the voice test lab, with your E-3 result

Use this if you ran the Android setup audit (E-3). Replace `{E3}` with the result, for example "9 steps and 4 minutes".

> A real-India voice test lab: five ₹8–12k Android phones (Redmi, Realme, Samsung M, Tecno, Lava), a speaker that loops ceiling-fan, traffic-horn and pressure-cooker-whistle noise, and a lav mic. On my own phone, going from install to a first dictation took {E3}. I'd test every Wispr campaign and onboarding flow on the phones, and in the rooms, where India's next users actually talk.

380 characters without the placeholder, so you have **120 characters** for the result. The example with "9 steps and 4 minutes" comes to 401 characters.

Version 2: the voice test lab, if E-3 didn't happen

Ready as it is. Every number in it is already in `CLAIMS.md` (W4, S4).

> A real-India voice test lab: five ₹8–12k Android phones (Redmi, Realme, Samsung M, Tecno, Lava), a speaker that loops ceiling-fan, traffic-horn and pressure-cooker-whistle noise, and a lav mic. In India about half of Flow's use is on mobile, and 84% of visits to my own campus app come from phones. I'd test every Wispr campaign and onboarding flow on the phones, and in the rooms, where India's next users actually talk.

421 characters.

Version 3: the hostel booth, only if your diary says "couldn't speak here" was the top blocker

Replace `{E1}` with the place from your E-1 diary, for example "the library".

> A fold-out acoustic booth for a hostel room, and a lav mic. Tracking my own voice use through exam week, the place I most often couldn't speak was {E1}. Most Indian students share a room, so voice-first has to feel normal when someone's listening. I'd use the booth to film campus content and to test how dictation copes with quiet, half-whispered speech.

351 characters without the placeholder.

Rejected

- Walking pad: nothing shows it's genuinely you.
- Pour-over coffee rig: persona only, no growth value.

Part 8 · The posts

Dictate them with Flow. The tags are the one part you can't dictate: type @, then pick **Wispr Flow** and **Emergent** from the list so the company pages are actually tagged.

LinkedIn, ready to post

The default "what I learned" line is the Skipp one, which is true today. If your Tanglish or setup result is more interesting on Tuesday, swap in one of the lines below it.

> Over 2,000 people applied to Wispr Flow India last week, so Wispr asked applicants to build something with their voice instead of sending another resume.
>
> I built "the long version": my resume, squeezed onto one page. Tap any line, or just ask, and it opens the story behind it. I spoke every instruction into Emergent with Wispr Flow, during exam week.
>
> What I learned: the app I built for my campus is opened by 7 to 14 students a day, and over 92% of them come straight from their home screen. I'd built a habit, not distribution. That's the problem I want to work on next.
>
> Where voice broke for me: [the real moment from your voice log].
>
> The long version: [portfolio link]
>
> @Wispr Flow @Emergent

Swap-in "what I learned" lines:

- **Tanglish:**

  > What I learned: I said 12 everyday Tamil-English sentences into Flow and into Gboard. Flow got [F] ready to send as they were; Gboard got [G].

- **Setup:**

  > What I learned: setting up Flow on my Android phone took [STEPS] steps, and the slowest part was [SLOWEST]. That's where I'd start.

X, ready to post (under 280 characters)

> Wispr Flow asked India applicants to build with their voice. I built "the long version": my resume, squeezed onto one page, that opens up when you ask. Spoken into Emergent with Wispr Flow, during exam week. [portfolio link]

Then add the two tags by picking them from the @ list.

Part 9 · If something goes wrong

Problem	What to do
The Emergent credits haven't arrived after 10 hours	Check spam. Then email support@emergent.sh from your Flow email: "I registered for the Wispr Flow hiring challenge credits on [date] with this email and haven't received them." Tell me too.
Emergent has no Publish option	Stop and tell me before building more. The Free plan can't publish. We decide by Saturday noon: a paid Emergent plan, or another vibe-coding tool the challenge allows, used the same way by voice (and said so on the site).
Emergent rewrote your text	Say: "You changed my wording in the [section] section. Put back the exact text from the content I pasted, and don't edit my words again."
Emergent broke something	Say: "Undo your last change. Keep everything else exactly as it was." If a publish broke the live site: Manage Publishing → roll back.
Emergent keeps adding things you didn't ask for	Say: "Stop. Only build what I asked for. Remove the [thing]."
Something scrolls sideways on the phone	Say: "Something on the page is wider than a 375-pixel screen. Find it and fix only that."
The squeeze effect doesn't show	Say the scaleX line in Part 3, step 4.
Flow keeps mishearing a name	Add it to Flow's dictionary, say it again, and note it in your voice log.
Flow mangles colour codes, ids or links	Use the snippets (Part 3, last section), or paste. Note it in your voice log.
Out of Flow words for the week	Dictate on your phone, or use the student offer or Pro trial. Tell me.
The mic doesn't work on the site	Test the **published** URL, not Emergent's preview: previews can block the microphone. Firefox doesn't support it at all; that's expected.
The video runs over 3:00	Cut the demo to one question, and drop the reviews line.
No time for a test	Skip it. The site says "not run". Never estimate a result.
The form won't take the date	Use the date picker, not typing. The date is 09/12/2026.

Appendix · Every word on the site

This is every word on the site, ready to paste. The truth check was answered on 30 Oct 2026, and every line below is confirmed or uses your own words.

Section ids in backticks are a contract with the QA test. Keep them exactly as written.

The numbers come from `CLAIMS.md` (checked 29 Oct 2026). The exam-week results get filled in on Monday from `evidence/results.md`.

Top bar

- **Name:** Nikhil Balamurugan
- **Line:** starts 9 Dec 2026 · relocating to Bangalore
- **Button:** ask

`squeezed`: the short version (hero)

Eyebrow: THE SHORT VERSION

Headline, line 1: 2,000 people sent you this.

Headline, line 2 (italic, ballpoint blue): ask for the long version.

Under the headline: This is my resume, squeezed the way resumes squeeze people. Tap any line for the story behind it, or just ask.

The squeezed resume (each line on its own row; the three marked → open a long version):

- NIKHIL BALAMURUGAN · Chennai · nikhilbalamurugan@gmail.com · linkedin.com/in/nikhilb21 · github.com/Nikhil210206
- B.Tech Computer Science, SRM Institute of Science and Technology, Kattankulathur · 2024–2028 · CGPA 9.21
- → Skipp: attendance, marks and timetable app for SRM students · Jul 2026–now
- → Drishti: voice web agent for blind users, 11 Indian languages · Sep 2026–now
- → Recoup: payment recovery agent for Razorpay merchants · Aug–Sep 2026
- OneClick: Samsung PRISM GenAI Hackathon 2026 · WSF: Women Safety Framework (team)
- 93 merged pull requests · FitYou maintainer, 65 contributor PRs merged · GSSoC 2025 mentor
- Amazon ML Summer School 2026 · Samsung Innovation Campus · Web team head, SRM Insider Community
- Vision2Web 2026, 2nd place (Allotiq) · InnoHack 2026, 2nd in AI/ML · HackFusion 2026 finalist · Social Winter of Code, top 100
- NVIDIA LLM Evaluation · Oracle OCI AI Foundations · NPTEL Java (Elite + Gold) · NPTEL OOP (Elite + Silver)

Ask box placeholder: ask anything, like "what did you build that students use?"

Chips:

- something students actually use
- something with voice
- what failed
- how you decide
- what you'd do for Wispr India
- when can you start

Under the ask box (small): There's no AI behind this box. It matches your words against a list of phrases I wrote. If you use the mic, your browser's speech service turns speech into text (Chrome uses Google), and this site stores nothing.

`long-versions`: the long versions

Eyebrow: THE LONG VERSIONS

Headline, line 1: three things I built, told properly.

Headline, line 2 (italic): the problem, the choices, the evidence, and what didn't work.

`lv-skipp`: Skipp

Subtitle: know before you bunk · live at skipp.life

1. **The problem.** SRM's portal shows your attendance as a record. It doesn't answer the question students actually ask: how many more classes can I miss and still stay above 75%?
2. **Why I chose it.** On the Student Portal, none of this is easy to see. So I built an easier way.
3. **What I owned.** All of it, solo: the product, the design, the scraper, the app and the privacy model. 249 commits since 21 July 2026.
4. **What I built.**
   - An app that installs to your home screen and tells you, subject by subject, how many classes you can still skip.
   - A leave planner that shows what a day off will cost before you take it.
   - A grade forecast, and a timetable that runs on SRM's day orders.
   - When SRM's Student Portal refused requests from servers outside India, I routed those calls through a small server in Hyderabad.
   - Passwords are never stored on a server. They're encrypted on the student's own phone.
5. **The evidence** *(Vercel Web Analytics, as of 29 Oct 2026)*.
   - On a typical day last week, 7 to 14 people opened Skipp.
   - 84% of visits are on phones.
   - Over 92% of visits are direct, from the home screen or a bookmark.
   - 1,642 visitor-days since launch. Vercel resets its visitor ID every day, so I can't tell you how many distinct students that is, by design.

6. **What didn't work.** I built a habit, not a way to spread. Almost nobody arrives from a share, a search or a post. And the privacy choice I'm proud of means my own analytics can't count distinct students.
7. **What I'd do differently.** Skipp lets you save your week as a picture, and that picture carries no way back to Skipp. Next time, everything a student can share carries the way in.

`lv-drishti`: Drishti

Subtitle: a voice agent for blind Indians · working prototype

1. **The problem.** Screen readers make blind users step through a website one element at a time, and they're English-first. Indian sites are full of unlabelled icons and buttons, so booking a train ticket can take hundreds of keystrokes.
2. **Why I chose it.** For most people, voice is a convenience. For a blind user on an Indian website, it's the whole interface. I wanted to build for that case.
3. **What I owned.** A solo build, on Sarvam's speech, language and translation models.
4. **What I built.** You say what you want, in any of 11 Indian languages. Drishti then:
   - operates the website for you;
   - reads the options back in your language;
   - asks for a spoken "yes" before paying, submitting or deleting anything;
   - never types a password, an OTP or a card number, and never attempts a CAPTCHA.
5. **The evidence.**
   - Latest fresh live evaluation: 35 of 40 tasks completed, 0 safety incidents.
   - For spoken yes or no across languages, a simple keyword list beat a multilingual model: 47 of 50 with 0 unsafe "yes", against 31 of 50 with 9.
6. **What didn't work.** My first headline number was 40 out of 40, from a replay of recorded runs. A fresh live run said 32, so 32 is what I published. And no blind user has tried it yet.
7. **What I'd do differently.** Put it in front of three blind users before adding a single feature.

`lv-recoup`: Recoup

Subtitle: count what you caused · synthetic benchmark plus real test-mode payments

1. **The problem.** When a payment fails, most recovery systems retry on a fixed schedule, even when the error already says a retry can't work. An expired card needs a different card, not another attempt.
2. **Why I chose it.** Razorpay publishes what every error means. I wanted to see what happens when a system actually listens to it.
3. **What I owned.** A solo build.
4. **What I built.** A system that reads Razorpay's error and picks the action that fits the cause: a retry, a payment link, a different method, or nothing at all. It runs under hard limits: a contact budget, caps per customer, quiet hours, and an audit log that can only be added to.
5. **The evidence.**
   - On a synthetic benchmark of 12,004 cases, choosing the action by cause recovered about 5× more than a fixed retry (+512%).
   - Two real recoveries, end to end, in Razorpay test mode.

    - Contacting everyone "recovers" 44% of the money but causes only 22% of it. A naive dashboard would claim double.
6. **What didn't work.** My machine-learning model lost to a 20-line rule: it picked the right action for 3 of 11 failure causes, and the rule got 9. And an early version credited itself with a recovery it hadn't caused, because the customer had paid through the original checkout.
7. **What I'd do differently.** Every number here comes from a simulation, and I say so. The next step is real merchant data.

More work

- **FitYou.** As maintainer, I merged 65 pull requests from other contributors.
- **Open source.** 93 merged pull requests, 59 of them in other people's repositories (29 Oct 2026).
- **Allotiq.** Campus room booking that places every request at once instead of first come, first served. On the brief's own example, first come, first served placed 2 of 3 requests and Allotiq placed all 3. Built for the Vision2Web 2026 finals (2nd place), after my first-round project, Echo, qualified.
- **OneClick.** Turns a vague phone complaint into a verified one-tap fix. Built at the Samsung PRISM GenAI Hackathon 2026.
- **WSF.** A women's safety app with on-device audio threat detection. A team project.

`setbacks`: what doesn't fit on a resume

Eyebrow: WHAT DOESN'T FIT ON A RESUME

Headline, line 1: three times it went wrong.

Headline, line 2 (italic): and what I changed.

1. **Recoup lost to a simple rule, three times.**
    - *What happened:* the allocator, the part the whole project is named for, lost to a simple cause-aware baseline on its first three attempts.
    - *What I decided:* treat every loss as a bug, not a tuning problem. One was a model picking actions it shouldn't. One was a threshold quietly blocking free retries. One was a comparison where only my system had to respect the budget.
    - *What changed:* every approach now runs under the same budget, and the write-up says plainly where my own machinery adds almost nothing.
2. **Skipp got shut out of the university's portal.**
    - *What happened:* SRM's Student Portal refuses requests from servers outside India. Skipp's server was abroad, so attendance stopped loading for students using the Student Portal.
    - *What I decided:* keep the server where it was, and only send those portal calls through India.
    - *What changed:* a small server in Hyderabad on Oracle's free tier now carries just those requests, and attendance loads again.
3. **Drishti's perfect score wasn't real.**
    - *What happened:* my evaluation said 40 out of 40. It was a replay of runs recorded at different times.
    - *What I decided:* run everything fresh, live, on one version of the code.

- *What changed:* it scored 32. I fixed the failures, and the latest fresh run is 35 of 40. That's the number I publish.

`principles`: how I decide

Eyebrow: HOW I DECIDE

Headline, line 1: three rules.

Headline, line 2 (italic): each one learned the hard way.

1. **Count what you caused.** Contacting every customer "recovers" 44% of the money, but only 22% happened because of the contact. The rest was coming anyway. In Recoup, a recovery only counts if the trail shows why.
2. **Publish the real number.** Drishti's replay said 40 out of 40 and the live run said 32, so I published 32. Skipp's dashboard says 1,642 visitors, but they're really visitor-days, so that's what I call them.
3. **Use the simplest thing that works, then measure it.** A 20-line rule beat my ML model in Recoup. A keyword list beat a multilingual model for spoken yes or no in Drishti. That's why the ask box on this page is a list of phrases I wrote, not an AI.

`exam-week`: exam week

Eyebrow: EXAM WEEK

Headline, line 1: I had exams every day.

Headline, line 2 (italic): so I tested voice on the busiest student I know: me.

Intro: I couldn't run sessions this week. So I wrote down what I expected before I started, measured what I could, and kept the campus trial for after exams. Every result below says how many people it covers. Mostly, that's one.

Cards (results filled on Monday from `evidence/results.md`):

1. **Voice diary.** A week of using Wispr Flow for every message, note and prompt. *Result:* [MONDAY]
2. **Tanglish test.** 12 everyday Tamil-English sentences, each said once into Wispr Flow and once into Gboard voice typing. *Result:* [MONDAY]
3. **Android setup.** From the Play Store to a first dictation, screen-recorded and counted step by step. *Result:* [MONDAY]
4. **What Indian users say.** Public reviews and posts about Wispr Flow, grouped by theme, with a sample checked by hand. *Result:* [MONDAY]
5. **The campus trial: designed, not run.**
   - 72 hours, three real tasks (a WhatsApp message, a paragraph of notes, a Tamil-English message), consent first, no incentives.
   - It tests whether students keep using voice once they've tried it, and what stops them first: setup, awkwardness or language.

- Ready to run after 4 November.

Limits (small text): One speaker, one phone, one campus, and no access to Wispr's own data. Read it as a first look, not a finding about India.

`wispr-ideas`: what I'd test first at Wispr India

Eyebrow: WHAT I'D TEST FIRST

Headline, line 1: three experiments.

Headline, line 2 (italic): none of them run yet, each with a reason to stop.

1. Campus referral loop

- **Who:** college students in South India, starting with one or two campuses.
- **Why:** Wispr says students are now picking up Flow, and Flow already rewards referrals. Skipp taught me campus reach doesn't happen on its own: over 92% of its visits come from people who already have it.
- **The test:** ten student ambassadors, one campus, two weeks. Invites tied to a real moment, like assignment week.
- **Measured by:** activated users per invite, meaning people who dictated on 2 or more days in their first week.
- **Guardrail:** whether referred users are still around at day 14.
- **Stop if:** ambassadors stop inviting, or the people they bring don't stick.

2. Regional creators, only when the language is ready

- **Who:** Tamil, Kannada and Telugu speakers who mix in English, on Reels and Shorts.
- **Why:** Hinglish came first, and India growth sped up after it. More Indian languages are planned within a year (TechCrunch). My Tanglish test is a first look at where Tamil-English stands today.
- **The test:** three micro-creators race a friend who's typing the same code-mixed message, and the video ends on Flow's unedited output. It runs only after the language passes a 50-sentence check.
- **Measured by:** activated installs per 1,000 views.
- **Guardrail:** comments about accuracy, and uninstalls.
- **Stop if:** accuracy complaints pass 10% of comments. That's a product fix, not a marketing problem.

3. First message home

- **Who:** new Android users on budget phones.
- **Why:** in India, about half of Flow's use is on mobile; Android only launched in 2026; and older users are often set up by younger family members (TechCrunch). 84% of Skipp's visits are on phones.
- **The test:** a guided first task: send your family group your first voice-typed message. Ten moderated tests on three budget phones, then a two-week A/B test.
- **Measured by:** the share of new installs with a successful dictation within 10 minutes.
- **Guardrail:** microphone-permission refusals, and uninstalls.

- **Stop if:** it doesn't lift first-session success by 10 points.

Note (small): None of these has been tested. They're where I'd start, and how I'd know to stop.

`how-built`: how I said this site into existence

Eyebrow: HOW THIS WAS BUILT

Headline, line 1: how I said this site into existence.

Headline, line 2 (italic): every instruction spoken, during exam week.

Who built what: I planned this site with an AI assistant, Claude, which drafted the copy from my own projects and notes. I spoke every build instruction into Emergent with Wispr Flow, and Emergent wrote the code. Exact strings like colour codes, ids and the phrase list went in as Flow snippets or a paste.

Numbers (filled from `build-log/voice-log.md`):

- I type at [N] words a minute. I dictated at [N].
- [N] instructions spoken into Emergent.

What voice did better: [MONDAY: two real observations from `voice-log.md`]

Where voice broke: [MONDAY: the real moment and the fix, for example adding project names to Flow's dictionary]

`logistics`: logistics

Eyebrow: LOGISTICS

Headline, line 1: the boring part.

Headline, line 2 (italic): answered up front.

- **Start:** 9 December 2026, right after my end-semester exams (25 Nov–7 Dec). Full time from then, including through next semester.
- **Location:** relocating to Bangalore for the full internship
